Congratulations for your assignment!

FEEDBACK

- Use the VCode `Format Document` command regularly for a well-formatted and readable code.

- Run your web pages through the `Chrome Lighthouse Auditing` Tool, follow the instructions and try to get the best possible score.

- Use meaningful and descriptive variable names. Avoid vague names such as `x`, `y`, etc.

- Clear your HTML from empty elements, e.g. `<header></header>` in `editAssignPerCourse.html` and other pages.

- Avoid inline JS (`onclick`) and prefer the `addEventListener` for adding event handlers.

- Prefer using the `template literals` when dynamically creating HTML elements in JavaScript, instead of using double/single quotes and the concatenate operator `+`.

- Consider pairing your `input` elements with `label` tags, and sync them through the `for/id` attributes.

- Consider running your image files through an optimization tool or platform such as TinyPNG to reduce their file size and make the web pages load faster.

- Study the following tips and improve your front end skills.

Keep up the good work!
